Crux

Lecture -14

Data Structures -3

Trees -1

Sumeet Malik

What's common between a
file system and a
company's organizational
structure?

Trees

Tree Terminologies

1. Node
2. Root
3. Children
4. Parent
5. Ancestor
6. Descendants
7. Sibling
8. Leaves

How to Implement a Node of a Tree

Node of a Tree

```
Public class node{  
    int data;  
    node[] children;  
    node parent; //Optional  
}
```

How to Implement a Tree

1. Use Nodes to create tree in every program
2. Define a Tree class

Tree class

```
Class Tree {  
    private node root;  
    public int size();  
    public boolean isEmpty();  
    public T root();  
    private node parent(node);  
    private node[] children(node);  
    // etc etc  
}
```

Lets see how to input and output Tree

1. Write a function to take tree as input from user
2. Print out a tree

Lets discuss few problems

1. Count number of nodes in a tree

Your Turn

1. Find the node with largest data in a tree

Tree Important Properties

1. Degree of a Node
2. Depth of a Node
3. Height of Tree

Lets discuss few problems

1. Find Height of a Tree
2. Print all the elements at depth K.

Your Turn

1. Find number of Nodes greater than an integer x
2. Find the node for which sum of the data of all children and the node itself is maximum

A tree walk or traversal is a way of visiting all the nodes in a tree in a specified order.

Lets code these tree traversals

1. Preorder Traversal(Recursive)
2. Preorder Traversal(Iterative)
3. Postorder Traversal
4. Levelorder Traversal

Thank You!
